

07/21/2020 – (CINT Commander II v6.42 – CINT Satellite v6.42)

This update includes some bug fixes and spelling error corrections. The CINT Commander program will now correctly load Sub-Recording files when clicked inside the main log and Hot-Key reports. The DVR Viewer encapsulation code has been upgraded for our newer model DVRs. Be sure to upgrade both programs, however this CINT Commander upgrade will still remain compatible with Satellite version 6.40 and up.

11/25/2019 – (CINT Commander II v6.41 – CINT Satellite v6.41)

This update includes several feature additions along with some operability improvements. You can now double-click a notation within the main log to instantly listen to the associated recording 10 seconds before the scribe entered the notation. This feature is also available within Hot Key Reports. This update also includes a more robust load algorithm for the Satellite software along with several fixes in the A2DP (Bluetooth speaker) functions.

5/10/2019 – (CINT Commander II v6.40 – CINT Satellite v6.40)

This is a ***very important update***. It resolves issues caused by Microsoft's new Virtual Network Adapter implementation (read more in our forum). There were huge changes to the overall networking processes of the code, which in the end increased the robustness of our software. Also in this update; you can now click on an MP3 in the main log to load and play it (like a hot link) and there is a new Deadline countdown timer function (in Tools menu).

This update required modifications to every part of our code (4 executables in total). Therefore you must download and replace both the main CINT Commander II Program and the Satellite programs. Be sure to uninstall any previous versions before installing these new versions.

4/3/2019 – (CINT Commander II v6.39)

This update addressed some minor issues and spelling errors. There were some significant changes to the debugging logger, which will make future troubleshooting easier for me!! There was no change to the CINT Satellite program for this update.

12/06/2018 – (CINT Commander II v6.38)

This update adds a new Landline Region settings window to replace the Advanced Timing function for the detection of incoming calls in Landline Mode. The CINT Commander II is now compatible with the United States and 4 other countries that have our system (Brazil, Canada, Poland and Chile). The new function includes a tolerance setting to account for inaccuracies in telephone companies and Telular devices. There was no change to the CINT Satellite program for this update.

08/13/2018 – (CINT Commander II v6.37 – CINT Satellite v6.37)

This update fixes a few minor issues in both programs, including some spelling errors (whoops). This version has been thoroughly tested and proven solid. I don't anticipate any further updates in 2018, except of course if someone finds a serious error on my part. I highly recommend updating all your PCs to these versions. Remember to uninstall previous versions before running the new installer.

05/23/2018 – (CINT Commander II v6.35 – CINT Satellite v6.35)

This update includes some new features, including a Voice Chat function between Satellite PCs and the NOC PC. The file transfer algorithms have been completely re-written to ensure safe data transfers of Records files and attachment files. There's a new function to allow users to "tune" the CINT Commander to their Telular (or similar) device to ensure proper Landline ring detection. There were several identified bugs that have been fixed as well. Be sure to update both the CINT Commander and all Satellites to this new revision.

11/06/2017 – (CINT Commander II v6.34 – CINT Satellite v6.34)

This upgrade includes a VAST amount of code corrections and capability additions. A new graphical audio playback function has been added along with a full records database. We've added more user settable diversity to customize functionality to your agency and its needs. Many identified issues have been addressed in this revision. For a more detailed explanation, please log on to our forum and review the CINT Commander II evolution thread.

The Satellite Software was also updated to v6.34. Because of the vast additions to the code, it too must be updated. Older versions of the CINT Satellite will not be compatible with the CINT Commander II v6.34. Also, to alleviate confusion, I've merged the revision numbers for both programs to 6.34.

10/03/2016 – (CINT Commander II v1.40 – CINT Satellite v6.18)

This update fixed several issues, including the proper path references when using pretext mode. Focus was placed on the handling of the Speakerphone controls. The sensors button (not yet implemented) has been converted to a Force Hang-up button. This function will be available when exiting speakerphone mode and will help "pop" the Tactical Phone back on hook if it fails to receive the hang-up FSK command. I also streamlined some of the MP3 Encoder code to appease slower laptops. It contains numerous upgrades, additions and fixes.

The Satellite Software was also updated to v6.18. It received fixes in path assignments also along with an improved data error handler.

06/02/2016 – (CINT Commander II v1.36 – CINT Satellite v6.16)

This update fixed several issues, including when reloading a paused incident (NPP Report was not re-loading correctly). It also has many functional additions. You can now optionally set the network server to come on automatically at the beginning of an event. You can export and import all program settings (including personnel list). It includes a Hot Key data mining function which allows you to generate a report for each of the dynamic hot keys. It has 3 "Others on Scene" tracked fields for personnel management and records keeping. The Satellite software (v6.16) has been updated to allow and utilize these functions remotely.

This update requires that the CINT Satellite software also be updated to version 6.16.

08/19/2015 – **Update 1.24** (CINT Commander II v1.24 Program)

This update includes the addition of an upgraded HOBAS report creator. There were numerous issue fixes included in this version as it continues to grow in complexion and capability.

03/17/2015 - Update 1.08 (CINT Satellite v6.04)

This update includes numerous fixes along with several additions to the code. New faster streaming algorithms will allow audio streaming on older laptops. Pretext functions added. New Evidence Reviewer written and added (placed on Evidence CDs). Additional functionality added to the Satellite Program.

The CINT Commander and CINT Satellite programs will both need to be replaced for this update.

02/23/2015 - Update 1.07 (CINT Satellite v6.02)

This update fixes several issues and adds a complete global attachment function to both programs. Any type of file can now be attached to the incident from either the CINT Commander program or any Satellite user. Attachments are noted in main log and saved to data CD at the conclusion of the incident.

The CINT Commander and CINT Satellite programs will both need to be replaced for this update.

February 2015: 836 Technologies releases the CINT Commander II (finally). The first software version is 1.04 (CINT Satellite v6.01). This version has no evidence reviewer (for save disks) and no Pretext Call abilities yet. These functions will come soon in updates.

Whenever updating, be sure to FULLY UNINSTALL any previous versions!!
